Automated Network Request Management in ServiceNow

Date	
Team ID	
Project Name	**Automated Network Request Management in ServiceNow**
Maximum Marks	5 Marks

Project Overview

Automating network request management in ServiceNow enhances operational efficiency by streamlining workflows, reducing manual interventions, and ensuring real-time updates. This project implements a fully automated and scalable network change management process in ServiceNow to automate user-initiated network requests, ensuring rapid fulfillment, audit-ready change records, and accurate configuration tracking.

Product Backlog, Sprint Schedule, and Estimation (4 Marks)

The table below presents the product backlog and sprint schedule for the Automated Network Request Management project. Requirements are organized into Epics, broken down into user stories (USN), and estimated using Fibonacci story points (1, 2, 3, 5, 8).

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Requirement Gathering & Catalog Design	USN-1	As an admin, I can gather and document the functional requirements for automating network request management.	2	High	
Sprint-1		USN-2	As an admin, I can design and configure the Network Request catalog item in the ServiceNow Service Catalog.	3	High	
Sprint-1		USN-3	As a user, I can view the available network request types (new connection, IP change, VLAN change, firewall access) in the catalog.	2	High	
Sprint-1	Request Submission & Data Capture	USN-4	As a user, I can submit a network request by filling out a dynamic catalog form with the required details.	3	High	

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1		USN-5	As a user, I receive a unique request item number (RITM) immediately after submitting my request.	1	High	
Sprint-2	Workflow Automation & Approval Routing	USN-6	As a system, I can automatically route a submitted request to the correct approval group based on request type and impact.	5	High	
Sprint-2		USN-7	As an approver, I can approve or reject a network request directly from email or the ServiceNow portal.	3	High	
Sprint-2		USN-8	As a system, I can automatically escalate a pending approval once its SLA is breached.	5	Medium	
Sprint-2	Change & Configuration Management	USN-9	As a system, I can auto-generate an audit-ready Change Request (CHG) record once all approvals are complete.	5	High	
Sprint-2		USN-10	As a network engineer, I can view the Configuration Item (CI) details linked to a request from the CMDB.	3	High	
Sprint-2		USN-11	As a system, I can validate CI dependencies and detect conflicts before implementation begins.	3	Medium	
Sprint-3	Fulfillment Automation	USN-12	As a system, I can trigger automated network configuration scripts through Orchestration / MID Server once a change is approved.	8	High	
Sprint-3		USN-13	As a network engineer, I can view the real-time fulfillment status of a request on its record.	2	High	
Sprint-3		USN-14	As a system, I can automatically update the CMDB once the network change is implemented in production.	5	High	
Sprint-3	Notifications & Real-Time Updates	USN-15	As a user, I receive real-time email and portal notifications at each stage of my request's lifecycle.	2	Medium	
Sprint-3		USN-16	As a user, I can track the live status of my request on the Service Portal dashboard.	3	Medium	
Sprint-4	Audit Trail & Reporting	USN-17	As an auditor, I can view a complete, audit-ready trail of approvals, changes, and configuration updates for any request.	3	High	
Sprint-4		USN-18	As a manager, I can generate reports on network request SLA compliance and monthly volume trends.	3	Medium	
Sprint-4	Testing & Deployment	USN-19	As a QA tester, I can validate the end-to-end automated workflow in a sub-production instance before go-live.	5	High	
Sprint-4		USN-20	As an admin, I can migrate and deploy the completed automation to production using ServiceNow update sets.	2	High	

Project Tracker, Velocity & Burndown Chart (4 Marks)

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	11	6 Days	03 Aug 2026	08 Aug 2026		
Sprint-2	24	6 Days	10 Aug 2026	15 Aug 2026		
Sprint-3	20	6 Days	17 Aug 2026	22 Aug 2026		
Sprint-4	13	6 Days	24 Aug 2026	29 Aug 2026		

Velocity

The project is planned across 4 sprints of 6 days each (24 working days in total). Velocity is the average number of story points a team completes per sprint, and is used to forecast how much work can be delivered in future sprints.

Total Story Points (all sprints) = 11 + 24 + 20 + 13 = 68

Number of Sprints = 4

Velocity = Total Story Points ÷ Number of Sprints = 68 ÷ 4 = 17 Story Points per Sprint

The team's planned velocity for the Automated Network Request Management project is 17 story points per sprint.

Burndown Chart

A burndown chart is a graphical representation of work remaining versus time. It is widely used in Agile methodologies such as Scrum to track whether a team is on pace to complete the planned scope within the sprint or release. The chart below shows the ideal burndown line against the planned remaining story points across all four sprints of this project.

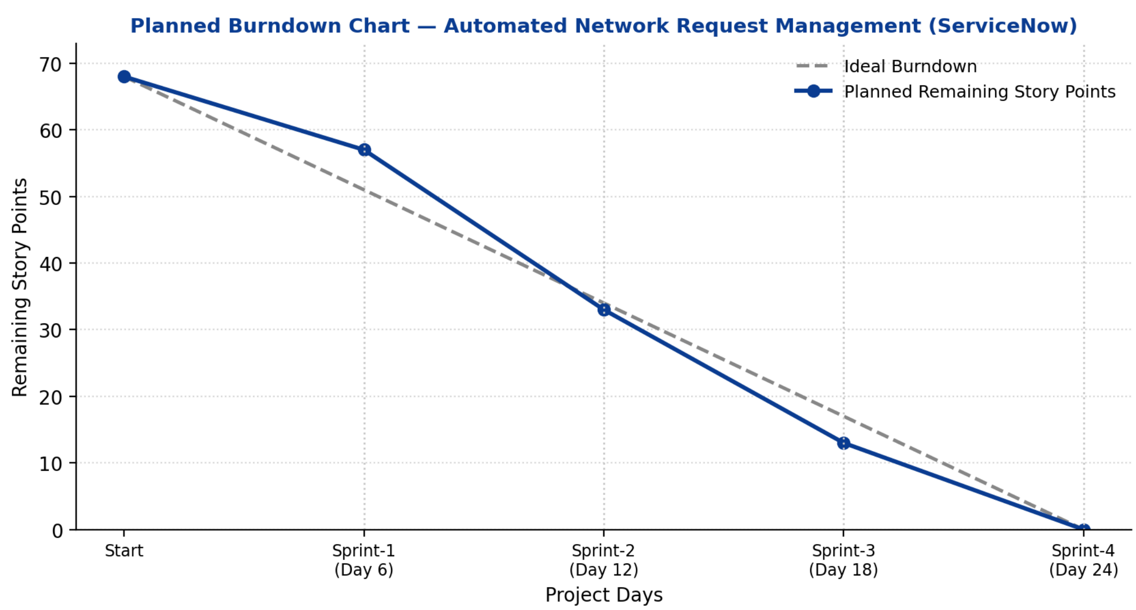

Figure 2: Planned Burndown Chart — Automated Network Request Management (ServiceNow)
