Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The Problem-Solution Fit simply means that a real customer problem has been identified and that the proposed solution actually solves that problem. It helps identify behavioral patterns in the network change request process and clarifies what will work, and why.

Purpose

- Solve the network change request problem in a way that fits how requesters, approvers, and engineers actually work today.
- Succeed faster by tapping into the existing ServiceNow platform already used across the organization.
- Sharpen the automation and communication strategy around the right triggers (e.g., onboarding, new deployments, audits).
- Increase trust in IT by solving frequent, costly, or urgent network request pain points.
- Understand the current, largely manual situation in order to design a fully automated replacement.

Problem – Solution Fit Canvas

CS 1. Customer Segment(s) • Enterprise employees, IT support staff, and network engineers who need network changes made (VLANs, firewall rules, port access, Wi-Fi access) as part of daily work. • Change Approvers / CAB members and IT Compliance & Audit teams who rely on the process outputs.	CC 6. Customer Constraints • Limited IT staffing available to manually triage and fulfill every request. • Incomplete or inconsistent CMDB data quality. • Defined change windows and maintenance policies restrict when changes can be made. • Regulatory/compliance mandates for documented approvals and audit trails.	AS 5. Available Solutions • Manual email or phone requests routed by hand to the network team. • Spreadsheet-based tracking with no real-time visibility or audit trail. • Basic ServiceNow ticket without dedicated workflow, validation, or CMDB integration. • Standalone network-automation scripts disconnected from the ITSM system of record.
J&P 2. Jobs-to-be-Done / Problems • Employees need a fast, simple way to request network changes without needing networking expertise. • IT teams need requests validated, correctly classified, and free of duplicate or incomplete data. • Approvers need clear, risk-assessed information to approve or reject changes quickly. • Engineers need to implement changes accurately and keep configuration records current. • Compliance teams need traceable, audit-ready records for every change.	RC 9. Problem Root Cause • The network change process evolved organically through email and ad-hoc tickets rather than being designed as a structured ServiceNow workflow. • As request volume grew, there was no standardized intake, validation, or CMDB integration — so requests are captured inconsistently, routed manually, and tracked poorly end to end.	BE 7. Behaviour • Requesters email the network team or raise a generic IT ticket, then follow up repeatedly by phone or chat for status. • Engineers track pending changes in spreadsheets or personal notes. • Approvers are chased individually for sign-off.

TR 3. Triggers

- A new employee joins and needs network / VPN access.
- A business unit deploys a new application requiring firewall or port changes.
- Growing volume of manual, ticket-based requests causes delays.
- Audit findings or compliance gaps trace back to undocumented changes.
- Network incidents are traced to unrecorded, ad-hoc changes.

SL 10. Your Solution

- A fully automated, scalable network change management workflow built natively in ServiceNow — combining a guided self-service catalog, automated validation and routing, workflow-driven approvals, orchestrated fulfillment, and automatic CMDB updates — to ensure rapid fulfillment, audit-ready change records, and accurate configuration tracking for every request.

CH 8. Channels of Behaviour

- 8.1 Online: Email, ServiceNow portal / ticketing, Slack / Teams requests, network monitoring dashboards.
- 8.2 Offline: Phone calls to the network team, in-person requests at CAB meetings, manual change forms in some legacy processes.

EM 4. Emotions: Before / After

- Before: frustrated by slow manual approval chains, anxious about whether the request was even routed correctly, unsure of status or timelines.
- After: confident the request was fulfilled correctly, reassured by real-time visibility, relieved that a complete audit trail exists automatically.
