Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Proposed Solution Template:

The following information describes the proposed solution for Automated Network Request Management in ServiceNow.

S.No	Parameter	Description
1.	Problem Statement (Problem to be solved)	Network change requests today are handled manually across email, generic tickets, and spreadsheets. This results in slow fulfillment, inconsistent validation, incomplete audit trails, and configuration data (CMDB) that drifts from the actual network state — creating operational risk and compliance exposure.
2.	Idea / Solution description	Implement a fully automated, scalable network change management process natively within ServiceNow. Users submit requests through a guided self-service catalog; the platform automatically validates and routes each request, drives risk-based approvals through Change Management, orchestrates fulfillment through automation and integration tooling, and automatically updates CMDB and generates audit-ready records at closure.
3.	Novelty / Uniqueness	Unlike siloed ticketing or manual spreadsheet tracking, this solution unifies request intake, approval, automated fulfillment, and CMDB reconciliation into a single closed-loop ServiceNow workflow — with orchestration-driven configuration changes and audit-ready records generated automatically rather than compiled after the fact.
4.	Social Impact / Customer Satisfaction	Reduces wait times and frustration for employees requesting routine network access, frees network engineers from repetitive manual work so they can focus on higher-value tasks, and improves organizational trust in IT through transparent, real-time status visibility.
5.	Business Model (Revenue Model)	Positioned as an internal IT efficiency solution: value is realized through reduced operational cost (fewer manual hours per request), lower compliance and audit risk, and improved SLA adherence. The workflow can also be packaged as a reusable ServiceNow accelerator template, licensed to other business units, or delivered as a managed implementation service for other organizations running ServiceNow.
6.	Scalability of the Solution	Built on ServiceNow's cloud-native platform using reusable Flow Designer workflows, IntegrationHub spokes, and CMDB APIs, the solution scales horizontally across network domains (LAN / WAN / Firewall / Wireless),

S.No	Parameter	Description
		business units, and growing request volumes without a proportional increase in manual headcount.
