

# Automated Network Request Management

## *Process & Customer Journey Map*

### **Project Documentation**

Prepared for: Network Operations & ITSM Platform Team

Platform: ServiceNow (ITSM / Change Management / Orchestration)

Document Type: Project Overview & Process Journey Map

Version: 1.0

# 1. Project Overview

Automating network request management in ServiceNow enhances operational efficiency by streamlining workflows, reducing manual interventions, and ensuring real-time updates. The objective of this project is to implement a fully automated and scalable network change management process in ServiceNow that automates user-initiated network requests, ensures rapid fulfillment, maintains audit-ready change records, and provides accurate configuration tracking.

## 1.1 Business Objectives

- Reduce manual intervention across the network request lifecycle through automated workflows.
- Accelerate request fulfillment turnaround time while maintaining accuracy and control.
- Ensure every change is audit-ready with a complete, traceable record from request to closure.
- Maintain accurate, real-time configuration data through automated CMDB updates.
- Provide end users and stakeholders with real-time visibility into request and change status.
- Build a scalable process that supports growing volumes of network change requests.

## 1.2 Scope

This initiative covers the end-to-end lifecycle of a user-initiated network request within ServiceNow — from initial submission through validation, approval, automated fulfillment, and closure with audit reporting. It spans the ServiceNow Service Portal, Change Management, CMDB, Orchestration / IntegrationHub, and Performance Analytics modules.

## 1.3 Key Stakeholders

- End Users / Requesters — employees or teams submitting network change requests.
- Network Engineers — responsible for reviewing and implementing network configuration changes.
- Change Approvers / CAB — validate risk and authorize scheduled changes.
- ServiceNow Platform Team — owns workflow design, automation, and system integrations.
- Compliance / Audit Team — relies on accurate, audit-ready change records.

## 1.4 Process Snapshot

The process is organized into five automated stages — Initiate Request, Validate & Route, Approve & Schedule, Fulfill & Implement, and Close, Audit & Report — detailed in the journey map on the following page.

### 3. Key Automation Opportunities Summary

The table below consolidates the highest-value automation opportunities identified across the journey, to be prioritized in the implementation phase.

| Stage                 | Priority Automation Opportunity                                 |
|-----------------------|-----------------------------------------------------------------|
| Initiate Request      | Introduce a Virtual Agent to recommend the correct request type |
| Validate & Route      | Expand real-time CMDB/topology integration                      |
| Approve & Schedule    | Add automatic escalation to backup approvers                    |
| Fulfill & Implement   | Build automated rollback playbooks for failed changes           |
| Close, Audit & Report | Add a post-closure satisfaction survey / feedback loop          |

#### 3.1 Expected Outcomes

- Faster end-to-end turnaround for network change requests through reduced manual handling.
- Consistent, audit-ready records for every change, supporting compliance and audit readiness.
- Accurate, real-time CMDB configuration tracking aligned to actual network state.
- A scalable workflow architecture able to absorb growing request volumes without added headcount.

## AUTOMATED NETWORK REQUEST MANAGEMENT

## 2. Process Journey Map

Scenario: A network engineer or business user requests a network change — such as VLAN provisioning, firewall access, or port configuration — through ServiceNow, from initial submission through automated fulfillment and audit-ready closure.

| STAGE                                                                                                                                                              | 1 Initiate Request                                                                                                                                                                                                                                             | 2 Validate & Route                                                                                                                                                                                                                                                                           | 3 Approve & Schedule                                                                                                                                                                                                                           | 4                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|  <b>Process Steps</b><br><i>What does the requester or system experience?</i>     | <ul style="list-style-type: none"> <li>User identifies a network need (e.g., new VLAN, firewall rule, port access)</li> <li>Logs into the ServiceNow Service Portal</li> <li>Selects the Network Request catalog item and completes the guided form</li> </ul> | <ul style="list-style-type: none"> <li>System runs automated validation (duplicate check, mandatory fields, CMDB correlation)</li> <li>Request auto-classified by network domain (LAN / WAN / Firewall / Wireless)</li> <li>Routed automatically to the correct fulfillment queue</li> </ul> | <ul style="list-style-type: none"> <li>Change workflow triggers automatically based on risk/type</li> <li>Approvers notified via email and mobile app</li> <li>Approve or reject with comments; change added to the Change Calendar</li> </ul> | <ul style="list-style-type: none"> <li>•</li> <li>•</li> <li>•</li> <li>•</li> </ul> |
|  <b>System Interactions</b><br><i>What tools, people, and data are involved?</i>  | <ul style="list-style-type: none"> <li>ServiceNow Service Portal</li> <li>Network Request catalog item</li> <li>Guided dynamic request form</li> <li>Knowledge base articles</li> </ul>                                                                        | <ul style="list-style-type: none"> <li>Flow Designer / IntegrationHub</li> <li>Configuration Management Database (CMDB)</li> <li>Business rules &amp; assignment rules engine</li> </ul>                                                                                                     | <ul style="list-style-type: none"> <li>ServiceNow Change Management module</li> <li>Automated approval workflow</li> <li>Mobile push notifications</li> <li>Change Calendar / collision detection</li> </ul>                                   | <ul style="list-style-type: none"> <li>•</li> <li>•</li> <li>•</li> <li>•</li> </ul> |
|  <b>Goals &amp; Motivations</b><br><i>"Help me..." / "Help me avoid..."</i>      | <ul style="list-style-type: none"> <li>Help me quickly find the right request type</li> <li>Help me avoid submitting an incomplete or incorrect request</li> </ul>                                                                                             | <ul style="list-style-type: none"> <li>Help me ensure the request reaches the right team without delay</li> <li>Help me avoid manual triage errors</li> </ul>                                                                                                                                | <ul style="list-style-type: none"> <li>Help me review and decide quickly</li> <li>Help me avoid conflicting or unauthorized changes</li> </ul>                                                                                                 | <ul style="list-style-type: none"> <li>•</li> <li>•</li> <li>•</li> </ul>            |
|  <b>Positive Moments</b><br><i>What works well at this stage?</i>               | <ul style="list-style-type: none"> <li>Guided, structured forms reduce input errors</li> <li>Clear catalog categories speed up request creation</li> </ul>                                                                                                     | <ul style="list-style-type: none"> <li>Instant validation feedback with no duplicate manual re-entry</li> <li>Automatic routing removes queue guesswork</li> </ul>                                                                                                                           | <ul style="list-style-type: none"> <li>Mobile approvals speed up decision turnaround</li> <li>Built-in collision detection improves change visibility</li> </ul>                                                                               | <ul style="list-style-type: none"> <li>•</li> <li>•</li> <li>•</li> </ul>            |
|  <b>Negative Moments / Pain Points</b><br><i>What causes friction or delay?</i> | <ul style="list-style-type: none"> <li>Users are sometimes unsure which catalog item applies to their need</li> <li>Missing details trigger manual follow-up</li> </ul>                                                                                        | <ul style="list-style-type: none"> <li>Incomplete CI data causes routing exceptions</li> <li>Legacy requests sometimes need manual reclassification</li> </ul>                                                                                                                               | <ul style="list-style-type: none"> <li>Approvals can stall when approvers are unavailable</li> <li>Risk assessment can be unclear for complex changes</li> </ul>                                                                               | <ul style="list-style-type: none"> <li>•</li> <li>•</li> <li>•</li> </ul>            |
|  <b>Areas of Opportunity</b><br><i>How might we improve this stage?</i>         | <ul style="list-style-type: none"> <li>Introduce a Virtual Agent to recommend the correct request type</li> <li>Auto-populate fields using existing CMDB/user data</li> </ul>                                                                                  | <ul style="list-style-type: none"> <li>Expand real-time CMDB/topology integration</li> <li>Apply ML-based auto-classification for edge cases</li> </ul>                                                                                                                                      | <ul style="list-style-type: none"> <li>Add automatic escalation to backup approvers</li> <li>Introduce data-driven risk scoring from change history</li> </ul>                                                                                 | <ul style="list-style-type: none"> <li>•</li> <li>•</li> <li>•</li> </ul>            |
