

Project Design Phase-II

Data Flow Diagram & User Stories

Date	
Team ID	
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD depicts the right amount of system requirement graphically — it shows how data enters and leaves the system, what changes the information, and where data is stored.

Level-0 (Context) Data Flow Diagram

Automated Network Request Management in ServiceNow

User Stories

The table below lists the user stories for the Automated Network Request Management in ServiceNow solution, grouped by user type and functional requirement (epic).

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance Criteria	Priority	Release
Requester (Employee)	Request Submission	USN-1	As a requester, I can submit a network change request (firewall / VLAN / VPN) through the self-service catalog by entering the required details.	Request is created with a unique number and auto-routed for approval	High	Sprint-1

		USN-2	As a requester, I receive a confirmation notification once my request is submitted.	Confirmation e-mail / portal alert is received immediately	High	Sprint-1
	Request Tracking	USN-3	As a requester, I can track the real-time status of my request on a dashboard.	Dashboard reflects current stage: submitted, approved, in-progress, completed	Medium	Sprint-2
		USN-4	As a requester, I can attach supporting documents or diagrams to my request.	Attachments are saved and visible to approvers and the network team	Low	Sprint-2
Approver (Manager / Security)	Approval Workflow	USN-5	As an approver, I automatically receive requests for approval based on predefined routing rules.	Request appears in my approval queue within the configured routing order	High	Sprint-1
		USN-6	As an approver, I can approve or reject a request with comments from e-mail or the ServiceNow interface.	Decision and comments are logged against the request record	High	Sprint-1
		USN-7	As an approver, I receive an automatic escalation reminder if a request is pending beyond its SLA.	Escalation notification is sent to the next approver / manager after SLA breach	Medium	Sprint-2
Network Administrator	Change Fulfilment	USN-8	As a network administrator, I receive the approved change with all technical details pre-populated.	Change record contains complete configuration details needed for fulfilment	High	Sprint-2
	Configuration Management	USN-9	As a network administrator, the CMDB is automatically updated once a change is implemented.	Configuration item reflects the new state immediately after closure	High	Sprint-2
		USN-10	As a network administrator, I can generate a rollback plan template automatically for high-risk changes.	Rollback plan is attached to the change record before implementation	Medium	Sprint-3
ServiceNow Administrator	Workflow Configuration	USN-11	As a ServiceNow administrator, I can configure approval workflows and routing rules without code changes.	New routing rule is active without requiring a platform release	Medium	Sprint-2
Compliance / Audit User	Audit & Reporting	USN-12	As an audit user, I can generate an audit-ready report of all network changes within a date range.	Report exports with request, approval, fulfilment, and CMDB update history	High	Sprint-3
